Wave Nature of Electron

As a young graduate student at the University of Paris, Louis DeBroglie had been impacted by <u>relativity</u> and the <u>photoelectric effect</u>, both of which had been introduced in his lifetime. In his PhD thesis he proposed that matter and light possess the same common properties. The photoelectric effect pointed to the particle properties of light, which had been considered to be a wave phenomenon. He wondered if electons and other "particles" might exhibit wave properties. The application of these two new ideas to light pointed to an interesting possibility:

Relativity
$$E = mc^2 = \sqrt{p^2c^2 + m_0^2c^4} \qquad \begin{array}{c} \text{mass} = 0 \\ \text{mass} = 0 \\ \text{Kinetic} \\ \text{energy} \\ \text{term} \end{array} \qquad \begin{array}{c} \text{Hest mass} \\ \text{energy} \\ \text{term} \end{array} \qquad \begin{array}{c} \text{Momentum of a photon} \\ \text{a photon} \\ \text{p} = \underline{E} \\ \text{c} \end{array} \qquad \begin{array}{c} \lambda = \frac{h}{p} \\ \text{for} \\ \text{photon} \end{array} \qquad \begin{array}{c} \frac{2}{h} = \frac{h}{mv} \\ \text{for photon} \\ \text{electron?} \end{array}$$
 Photoelectric $E = hf = \underline{hc}$ $\lambda = hc$ relation

$$h = 6.626 \times 10^{-34} \text{ J sec}$$

 $c = 2.98 \times 10^8 \text{ m/sec}$

Confirmation of the DeBroglie hypothesis came in the <u>Davisson-Germer experiment</u>.

Example for Typical Inner shell Electron (v=1/2c) $\lambda = h/(mv) \quad 6.626 \times 10^{-34}/(9.109 \times 10^{-31} \text{ kg} \times 0.5 \times 3.0 \times 10^{8} \text{ m/sec})$ $4.85 \times 10^{-12} \text{m or } 0.0485 \text{ A}^{\circ} \sim 1/20 \text{ of A}^{\circ}$
